Power BI Interactive Dashboard Report

Dashboard Overview:

This business intelligence report synthesizes core commercial performance indicators, revenue concentrations, channel contributions, and profitability drivers from the Power BI Dataset 5 dashboard. Covering transactional activity from 12-01-2024 to 11-01-2026, the platform integrates multi-store retail operations across seven product categories, tracking gross revenue, operational costs, net profit margins, and order volume across physical and digital storefronts.

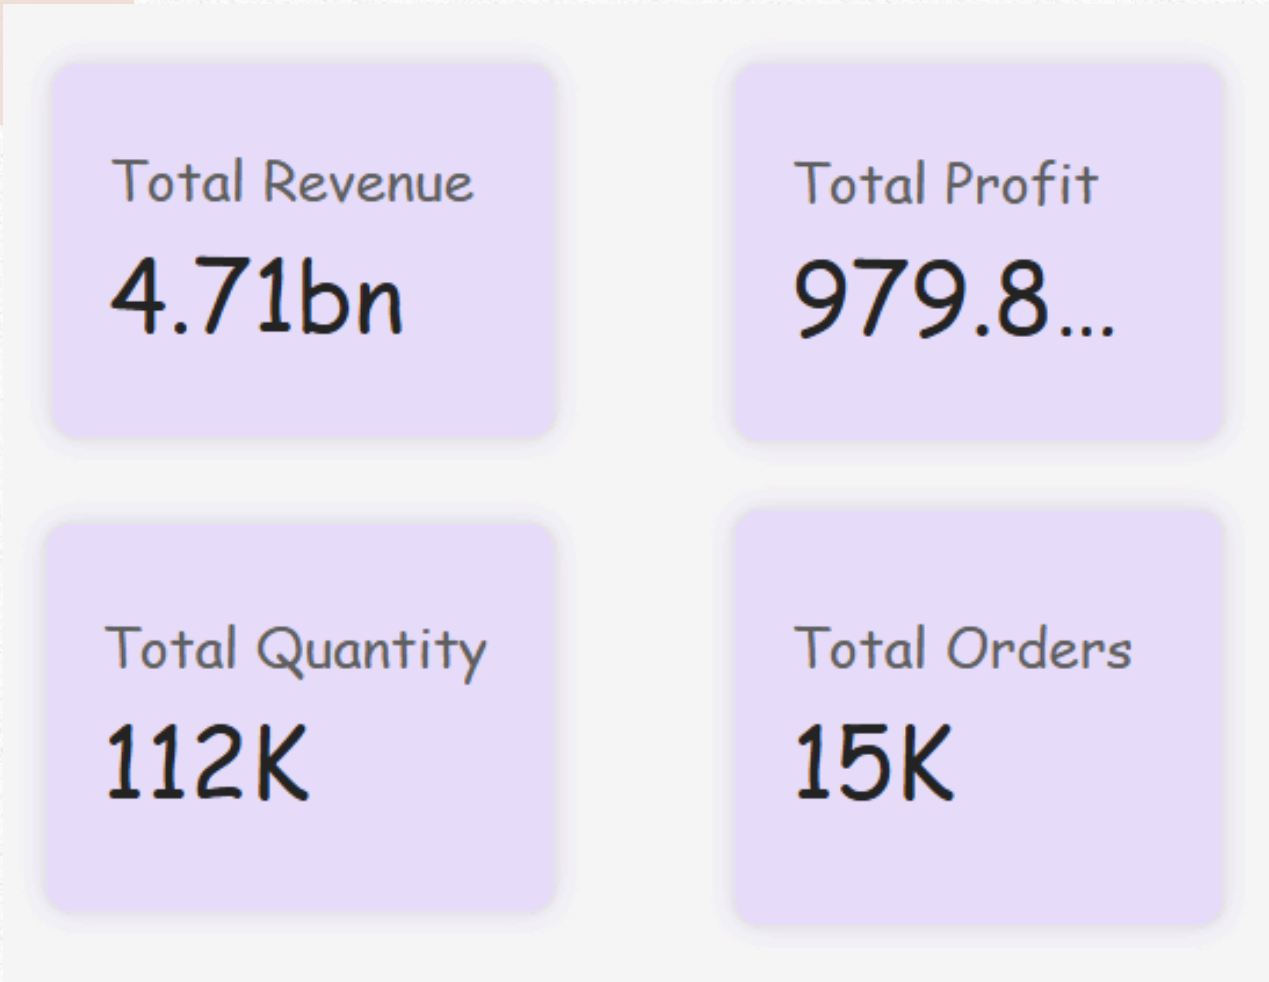

Primary Power BI dashboard overview featuring global KPI cards, categorical and geographic revenue distributions, store-type channel share, profit treemap, and longitudinal monthly trend.

1. KPI and Financial Exposure Analysis:

A comprehensive review of the top-level card visuals establishes baseline commercial telemetry across order frequency, unit movement, gross turnover, and operating cost structures.

KPI Metric	Dashboard Display	Analytical Interpretation
Total Revenue	4.71bn	Cumulative gross sales value generated across all channels, cities, and product lines during the monitored window.
Total Cost	4bn	Aggregate cost of goods sold and operational expenditure (~84.9% cost-to-revenue ratio).
Total Profit	979.89M	Net realized profit across all transactions, reflecting an overall gross profit margin of approximately 20.8% against reported revenue.
Average Order Value	313.80K	Mean monetary value generated per individual order event (4.71bn across ~15K orders).
Total Transactions / Orders	15K	Total completed order count recorded across physical flagship, mall, urban, suburban, and online channels.
Total Quantity	112K	Total physical product units sold across all 15K orders, indicating an average basket size of ~7.47 units per transaction.

Focused view on core volume and financial KPI cards confirming consistency between Total Transactions and Total Orders (15K) alongside truncated profit formatting (979.89M).

Data Considerations & Integrity Notes

- KPI Rounding & Summation Variance: Displayed rounded values for Total Cost (4bn) and Total Profit (979.89M) sum to ~4.98bn rather than exact Total Revenue (4.71bn), attributable to Power BI billion-level display rounding (e.g., ~3.73bn actual cost rounded up to 4bn).

- Case-Sensitivity Duplication in Dimensions: Both the Total Revenue by store_type donut chart and the customer_segment slicer contain duplicate categories separated solely by letter casing (Urban vs. urban; PREMIUM vs. Premium), splitting aggregated metrics across separate slices.

2. Category & Profitability Breakdown

Evaluating revenue generation alongside category-level profit contribution highlights heavy commercial reliance on high-ticket consumer electronics.

Revenue Concentration by Product Category

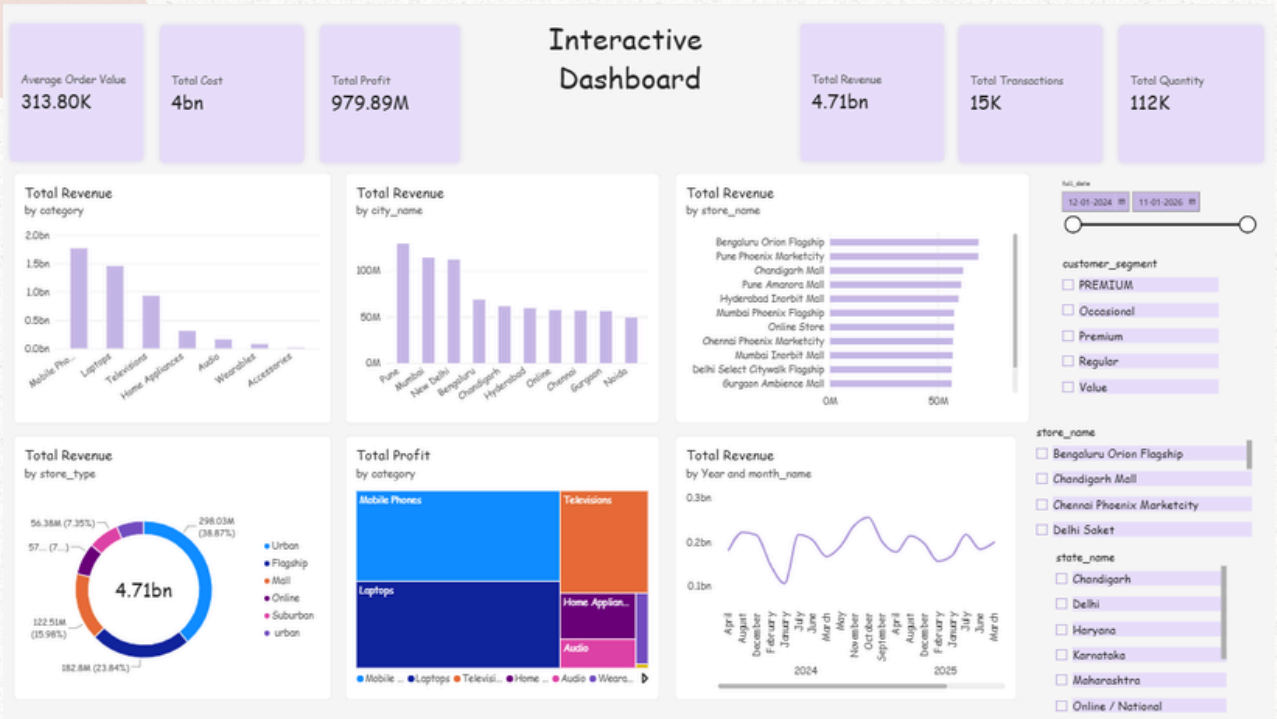

Sales across the seven tracked categories exhibit a steep Pareto distribution. Mobile Phones lead all product lines at approximately 1.75bn, followed closely by Laptops (~1.45bn) and Televisions (~0.95bn). Together, these top three electronics categories generate over 88% of total enterprise revenue (4.15bn of 4.71bn). Secondary categories—Home Appliances (~0.30bn), Audio (~0.15bn), Wearables (~0.08bn), and Accessories (~0.03bn)—account for the remaining ~12% of turnover.

Profit Contribution Treemap

The Total Profit by category treemap mirrors the top-line revenue hierarchy. Mobile Phones and Laptops occupy the two largest profit blocks, followed by Televisions on the upper right. Home Appliances and Audio provide moderate supplementary margin, while Wearables and Accessories contribute minimal net profit due to lower unit price points and smaller sales volumes.

3. Geographic, Channel & Temporal Dynamics

Cross-referencing geographic performance, store formats, and longitudinal monthly trends reveals clear regional anchors and cyclical demand patterns.

Full interactive dashboard layout displaying analytical visuals alongside dynamic slicers for full_date, customer_segment, store_name, and state_name.

Geographic & Store-Level Performance

Across city_name, Pune leads all metropolitan markets (~130M), followed by Mumbai (~115M) and New Delhi (~112M). A secondary tier of cities—including Bengaluru (~68M), Chandigarh (~61M), Hyderabad (~59M), Online (~58M), Chennai (~57M), Gurgaon (~56M), and Noida (~49M)—maintains steady mid-market volume. At the individual outlet level (store_name), Bengaluru Orion Flagship and Pune Phoenix Marketcity tie as the top-performing locations (~65M each), ahead of Chandigarh Mall (~60M) and Pune Amanora Mall (~59M).

Store Type Channel Split

The Total Revenue by store_type donut chart demonstrates that physical retail formats dominate revenue capture. Combined Urban stores account for 45.32% of total revenue—split across capitalized Urban at 298.03M (38.87%) and lowercase urban at 49.46M (6.45%). Flagship outlets contribute 182.8M (23.84%), and Mall stores generate 122.51M (15.98%). Online (57.52M / 7.5%) and Suburban (56.38M / 7.35%) represent smaller shares of the visible channel breakdown.

Temporal Revenue Trajectory (2024–2025)

The longitudinal line chart (Total Revenue by Year and month_name) tracks monthly revenue fluctuations across 2024 and 2025 between 0.10bn and 0.26bn per month. Revenue experiences a pronounced seasonal trough in January 2024 (~0.105bn) before rebounding sharply to ~0.21bn and peaking in October 2024 (~0.255bn), coinciding with festive retail demand. A milder seasonal dip recurs in early 2025 (February ~0.16bn), followed by stable mid-year performance around 0.18bn–0.23bn.

Slicer & Filtering Diagnostics

The interactive dashboard incorporates four filtering dimensions: a continuous date range slider (full_date: 12-01-2024 to 11-01-2026) and multi-select lists for customer_segment (PREMIUM, Occasional, Premium, Regular, Value), store_name, and state_name (Chandigarh, Delhi, Haryana, Karnataka, Maharashtra, Online / National). Note that Online appears both within city_name and store_type, while Online / National is recorded under state_name.

4. Business Insights & Strategic Recommendations

Based on empirical patterns observed across product categories, store formats, seasonal curves, and data governance checks, the following strategic actions are recommended:

Observed Pattern	Strategic & Operational Recommendation
Dimension Case-Sensitivity Splits Urban vs. urban in store types; PREMIUM vs. Premium in customer segments.	ETL Data Standardization: Apply Power Query text normalization (Text.Proper or Text.Upper) on store_type and customer_segment columns during ingestion so fragmented categories consolidate accurately in visuals and slicers.
High Category Concentration Mobile Phones, Laptops, and Televisions drive >88% of revenue and profit.	Cross-Sell & Bundle Optimization: Introduce point-of-sale bundling pairing high-volume Mobile Phones and Laptops with higher-margin Accessories, Audio, and Wearables to lift basket profitability and reduce single-category exposure.
Q1 Seasonal Revenue Contraction Monthly revenue drops to ~0.105bn in Jan 2024 and ~0.16bn in Feb 2025.	Counter-Seasonal Promotions & Inventory Planning: Schedule targeted Q1 clearance campaigns and loyalty incentives for Regular and Premium segments while adjusting inventory replenishment ahead of the Q4 festive peak (October).
Under-Indexed Online Channel Online accounts for 7.5% of store-type revenue compared to >85% across physical formats.	Under-Indexed Online Channel Online accounts for 7.5% of store-type revenue compared to >85% across physical formats.

5. Conclusion & Technical Data Notes

Conclusion: The Power BI Dataset 5 dashboard provides clear executive visibility into a 4.71bn retail operation generating 979.89M in net profit across 15K transactions. Commercial performance is anchored by consumer electronics (Mobile Phones, Laptops, Televisions) and physical Urban, Flagship, and Mall storefronts in Tier-1 Indian metros. Resolving minor text-casing inconsistencies in the data model and implementing targeted Q1 and cross-category merchandising strategies will strengthen both reporting precision and net margin resilience

Technical & Data Notes

- All figures are extracted directly from the provided Power BI Dataset 5 dashboard screenshots; intermediate bar heights and monthly line coordinates represent visual estimations from plotted axes.

- The KPI card labeled Total Transactions on the main dashboard corresponds directly to Total Orders (15K) shown in the secondary KPI view.

- In the Total Revenue by store_type donut chart, the Online data label is partially truncated as 57... (7...) on the interactive view, with full values confirmed as 57.52M (7.5%) in the primary view.

- Display precision on Total Cost (4bn) reflects standard Power BI whole-billion auto-formatting rather than an exact integer boundary.
